Job Description: Python Backend Engineer

Company: Acme Technology Ltd. (fictional demo company)

Location: Xinyi District, Taipei (near City Hall MRT)

Type: Full-time

Salary: NT$60,000 - NT$70,000 per month (adjusted for experience)

About the company

We help traditional businesses move to high-performance technical architectures through data-driven and automated workflows. Current flagship projects include an automated recruiting decision system and an enterprise resource planning (ERP) integration. We are looking for teammates who care about clean code and sound data-structure design.

Responsibilities

- API design and development: build fast, stable, scalable RESTful APIs with Python (Flask / FastAPI / Django).
- Database management: design and tune database schemas (MySQL / PostgreSQL) for efficient data access.
- Workflow automation: write scripts for data processing, file reading (e.g. PDF parsing) and cross-system data sync.
- Cloud integration: connect third-party service APIs (Google Cloud API, Gemini API, Slack, etc.).
- Teamwork: ship features with frontend engineers and product managers in an agile process.

Requirements

- Education: bachelor's degree or above in computer science, information management or statistics.
- Language: strong Python skills.
- Experience: 2+ years of software development work or internship experience.
- Database: fluent in SQL, with complex-query optimization and data-cleaning skills.
- Version control: Git experience with team collaboration (GitHub / GitLab).
- English: able to read English technical documentation (TOEIC 750+ or equivalent).

Nice to have

- Big-data processing or data visualization tools (Tableau, Power BI).
- Deployment and operations experience on a cloud platform (AWS / GCP / Azure).
- Familiarity with unit testing and automated test frameworks.
- Experience writing technical documentation for large projects.
